### Abstract

The human back is composed of a complex structure of muscles, ligaments, tendons, disks, and bones, which work together to support the body and enable us to move around. The segments of the spine are cushioned with cartilage-like pads called disks. Problems with any of these components can lead to back pain. In some cases of back pain, its cause remains unclear. Low back problems affect the spines flexibility, stability, and strength, which can cause pain, discomfort and stiffness. Approximately 80% of individuals will experience an episode of lower back pain at some time during their life. Lower back pain is the fifth leading reason for patients visiting a doctor and the leading cause of work related disability. However, the underlying cause is usually not serious and may not even be identified by the doctor. Lower back pain is most common in patients between the ages of 20 and 40 years, but can be more severe and disabling in elderly patients. The ASM technique was implemented in private clinic with aims to increases the strength, stability & flexibility of spine & prevent the different kinds of back problems. As the pain was relieved almost and the patients will be encouraged to practice the ASM technique regularly, even after the pain has gone, to prevent back pain/problems recurrence and promotion of spinal column.

**Keywords:** Back pain; Kati shoola; Spinal movements; Kati graha; Low back pain

### 1. Introduction

According to Ayurveda *Kati Shoola* is a disease, it is mainly caused by vitiation of *Vata Dosha*. Some ancient texts also describe *Kati Shoola* as a symptom of some disorders such as *Kati Graha*, *Trika Graha*, *Prushta Graha*, *Kati Vayu*, *Trika Shoola*, *Prushta Shoola*, *Vataja Shoola*, *Trika Vedana*, and *Grudrasi Vata* [1,2,3].

Back pain is a common reason for absence from work and for seeking medical treatment. It can be uncomfortable and debilitating. It can result from injury, activity and some medical conditions.

Back pain can affect people of any age, for different reasons. As people get older, the chance of developing lower back pain increases, due to factors such as previous occupation and degenerative disk disease.

Lower back pain may be linked to the bony lumbar spine, discs between the vertebrae, ligaments around the spine and discs, spinal cord and nerves, lower back muscles, abdominal and pelvic internal organs, and the skin around the lumbar area.

Pain in the upper back may be due to disorders of the aorta, tumors in the chest, and spine inflammation.

The back forms the axis (central line) of the human body and consists of the vertebral column, spinal cord, supporting muscles, and associated tissues (skin, connective tissues, vasculature, and nerves). A hallmark of human anatomy is the concept of “segmentation,” and the back is a prime example. Segmentation and bilateral symmetry of the back will become obvious as you study the vertebral column, the distribution of the spinal nerves, the muscles of the back, and its vascular supply. Functionally, the back is involved in three primary tasks, as follows:

- *Support* - The vertebral column forms the axis of the body and is critical for upright posture (standing or sitting), as a support for the head, as an attachment point and brace for movements of the upper limbs, and as a support for transferring the weight of the trunk to the lower limbs.
- *Protection* - The vertebral column protects the spinal cord and proximal portions of the spinal nerves before they distribute throughout the body.
- *Movements* - Muscles of the back function in movements of the head and upper limbs and in support and movements of the vertebral column.

### 1.1. Surface Anatomy

- Vertebrae prominence: the spinous process of the C7 vertebra, usually the most prominent process in the midline at the posterior base of the neck.
- Scapula: part of the pectoral girdle that supports the upper limb; note its spine, inferior angle, and medial border.
- Iliac crests: felt best when you place your hands “on your hips.” An imaginary horizontal line connecting the iliac crests passes through the spinous process of the vertebra L4 and the intervertebral disc of L4-L5, providing a useful landmark for lumbar puncture or epidural block.
- Posterior superior iliac spines: an imaginary horizontal line connecting these two points passes through the spinous process of S2 (second sacral segment).

### 1.2. Vertebral Column

The vertebral column (spine) forms the central axis of the human body, highlighting the segmental nature of all vertebrates, and usually is composed of 33 vertebrae distributed as follows

- Cervical: seven total; first two called the atlas (C1) and axis (C2).
- Thoracic: 12 total; each articulates with a pair of ribs.
- Lumbar: five total; large vertebrae for support of the body's weight.
- Sacral: five fused vertebrae for stability in the transfer of weight from the trunk to the lower limbs.
- Coccyx: four total; Co1 often is not fused, but Co2-Co4 are fused (a remnant of embryonic tail).
- The actual number of vertebrae can vary, especially the number of coccygeal vertebrae.

The atlanto-occipital joint permits flexion and extension (e.g., nodding in acknowledgment), and the atlanto-axial joint allows side-to-side movements (rotation; e.g., indicating “no”). This is accomplished by a uniaxial synovial joint between the dens of the axis and its articulation with the anterior arch of the atlas. The dens functions as a pivot that permits the atlas and attached occipital bone of the skull to rotate on the axis. Alar ligaments limit this side-to-side movement so that rotation of the atlanto-axial joint occurs with the skull and atlas rotating as a single unit on the axis

### 1.3. Movements of the spine are a function of the following features

- Size and compressibility of the intervertebral discs
- Tightness of the joint capsules
- Orientation of the articular facets (zygapophysial joints)
- Muscle and ligament function
- Articulations with the thoracic cage
- Limitations imposed by the adjacent tissues and increasing age

### 1.4. Aims & objectives

- To see the efficacy of the treatment/ASM on back pain
- To increases the strength, stability & flexibility of spine
- Promotion of health of spinal column

## 2. Material and methods

A study was conducted at my private clinic “Om Ayurveda & Yoga Health Centre”, Davanagere, Karnataka, India. Total 60 cases with the age between 20-50 years were selected, out of which 38 are females, and 22 are males were visited to clinic with the complaints of back pain.

ASM sessions with a therapeutic focus were held daily for 60 min in morning sessions directed by me. Each session began with deep breathing exercises and relaxation techniques progressing to poses designed to begin with stretching and move into strengthening [Table 1]. The session ended with meditative relaxation. The first week slow & mild session emphasized restorative poses and the second week session was more movement based. The predesigned ASM program progressed from simple to more challenging movements over the 4-week course. Modification for restricted movement or painful positions was provided as needed. Safety issues were monitored.

### 2.1. Inclusion criteria: back pain due to

Low back pain, the most common musculoskeletal disorder, can have various causes. Physical examination, although not always revealing a definite cause, may provide clues to the level of spinal nerve involvement and relative sensitivity to pain. The following causes are identified most often:

- strained muscles or ligaments
- a muscle spasm
- muscle tension
- Adopting a much hunched sitting position when using computers can result in increased back and shoulder problems over time.
- Twisting
- over-stretching
- bending awkwardly or for long periods
- pushing, pulling, lifting, or carrying something
- standing or sitting for long periods
- straining the neck forward, such as when driving or using a computer
- long driving sessions without a break, even when not hunched
- sleeping on a mattress that does not support the body and keep the spine straight

### 2.2. Exclusion criteria

- Pregnancy
- Intervertebral disc rupture and herniation
- Fracture of vertebral bone
- Degenerative changes in vertebral facet joints
- Sacro-iliac joint and ligament involvement
- Metabolic bone disease
- Psychosocial factors
- Abdominal aneurysm
- Metastatic cancer
- Myo-fascial disorders

### 2.3. Assessment criteria

- X-ray
- MRI/CT scan
- ESR
- CBC

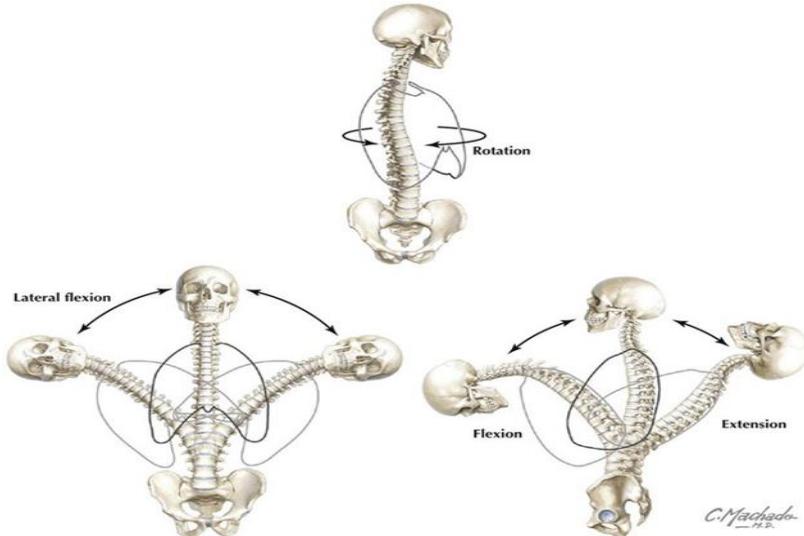

### 2.4. Advanced spinal Movements

- Stretch-fully (as patients comfort) clockwise & anti clockwise rotation of thoracic, lumbar and sacral spine in a wave like with slow motion for 10 rounds each.
- Stretch-fully movement of whole spine curvature from lower to upper & upper to lower in a wave like for 10 rounds each.
- Head & neck movements: - side ward bending, forward & backward bending & rotation clockwise & anti clockwise.

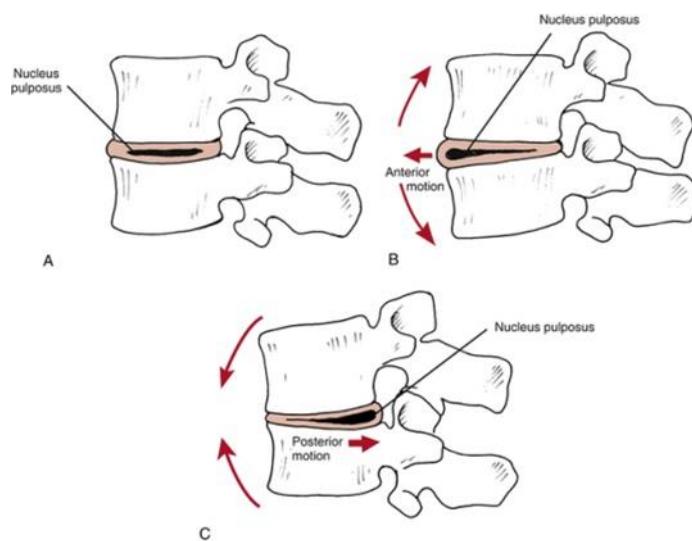

- Thoracic & lumbar: - side ward bending, forward & backward bending & fully stretch (as patient comfort) rotation clockwise & anti clockwise.
- Twisting

Above said A & B are special movements of spine (Fig. 1) & other essential movements (C, D & E) of the spine are flexion, extension, lateral flexion (lateral bending) and rotation (Fig. 2 & 3) are starts with 2-3 rounds with slow motion in beginning and gradually increased up to 10 round counts and the speeds up to medium level. Continue the procedure for 30 days.

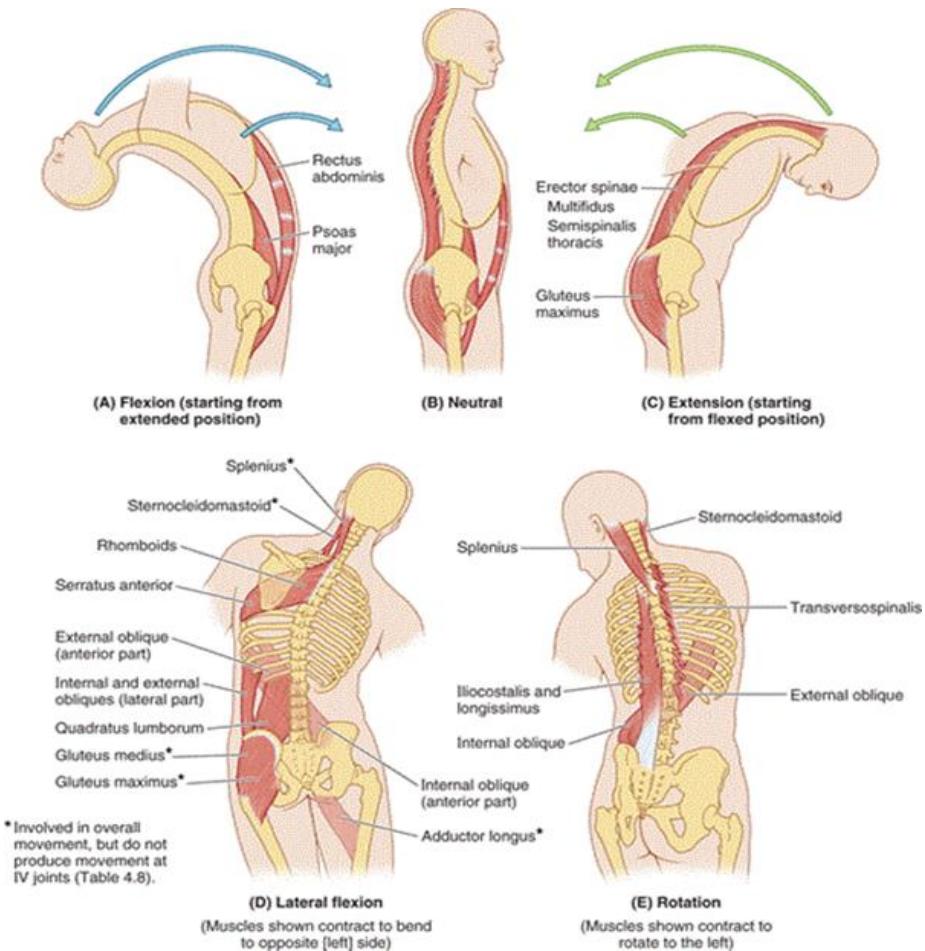

The greatest freedom of movement occurs in the cervical and lumbar spine, with the neck having the greatest range of motion. Flexion is greatest in the cervical region, and extension is greatest in the lumbar region. The thoracic region is relatively stable, as is the sacrum.

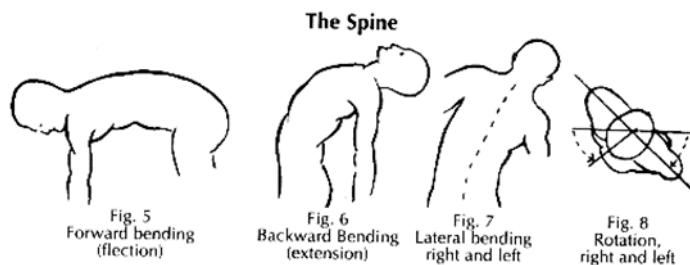

**Figure 1** Special spinal movements

**Figure 2** Effects of spinal movements on the intervertebral disc

**Figure 3** Effects of spinal movements on the muscles

**Figure 4** Essential spine movements

### 3. Results and discussion

The mean age of all subjects was 35 years, most were married. The mean body mass index (kg/m<sup>2</sup>) was 25.5, which is considered overweight. The average duration of the pain was greater than 3 months. The subjects identified the most common reasons for low-back pain as long standing working women, long time sitting without movements, bending or lifting injuries, work-related mild strains and unknown.

**Table 1** grading/scoring of pain while movements

Sl no	Intensity of pain	Grade
1	No pain	00
2	Occasional pain	01
3	Intermittent pain	02
4	Frequent pain	03
5	Continuous pain	04

**Table 2** grading/scoring of pain while flexion

S.no	Intensity of Pain on anterior flexion	Intensity of Pain on posterior flexion	Grade
1	No pain up to full flexion	No pain up to full flexion	00
2	Mild pain @ full flexion	Mild pain @ full flexion	01
3	Moderate pain @ full flexion	Moderate pain @ full flexion	02
4	Severe pain while flexion	Severe pain while flexion	03
5	Cannot flex	Cannot flex	04

**Table 3** Evaluation of clinical symptoms

Sr No	Symptoms	Before treatment grade	After treatment grade	t-value	p-value
1	30 patients - Pain in low back (kati shoola)	03	01	-215.072	<0.00001
2	20 patients - Pain in back (prushta shoola)	02	00	-118.654	<0.00001
3	10 patients - Neck pain (greeva shoola)	01	00	-82.819	<0.00001
4	Degree of anterior flexion	02	00	-643.614	<0.00001
5	Degree of posterior flexion	02	00	-643.614	<0.00001

We have observed after four weeks of ASM as per our regimen, the patients were relieved completely in 85-90% significantly in 15%, moderately in 10% and slightly in 6%. Patients reported no relief in 2% and pain. The result is very significant at  $p < 0.01$ .

ASM helps to relax the back muscles, releases stiffness at the back and strengthen the back muscles and it improve the movements & posture. Care must be taken that movements/exercises do not make back pain worse.

The patient will be encouraged to practice the techniques regularly, even after the pain has gone, to prevent back pain recurrence and promotion of spinal column.

#### 4. Conclusion

Advanced spinal movements are very good for individuals with back pain, because it does not have any risk of future back injuries or work absence. Substantial use ASM exercise as a therapeutic tool to improve impairments in spinal flexibility and strength. This study has improvements in pain ratings after ASM, and we sure that ASM can lessen the behavioral, cognitive, affect and disability aspects of back pain syndromes.
